**BIOMETRICS:** The reading of a person's unique, measurable biological characteristics is what is called Biometrics. Typically parts of the body involved are fingertips, facial features or retinal patterns. The goal is to validate identity & authenticate access to a physical area or electronic system.

This security technology, in the market of today, is rapidly evolving & it is anticipated that in the coming years it will be a technology to beat. It is a technology that its use cuts across different organisations: Government, Health Institution, Financial Institution, Military/Defence, Law enforcement agencies, Industrial (Oil & Gas) etc. Any organisation that has vulnerable assets & facilities needs to consider the introduction of this technology into its system to help mitigate risks associated with them.

Let's look at a graphical description of Biometrics Application in Banks:
